SPECIES OF ALBATROSSES

# WORLD ALBATROSS DAY

JUNE 19

## WANDERING ALBATROSS

> 11 kg

- Weighing over 9 kg, large males exceed 11 kg
- Among the largest of any flying bird

> 3.5 m

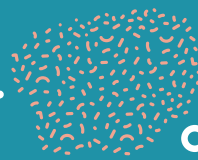

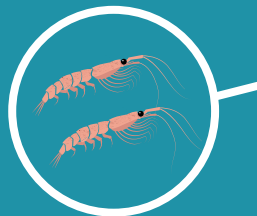

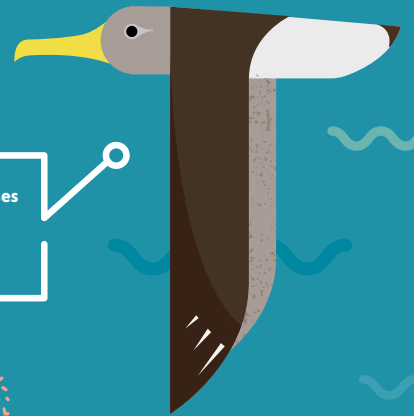

- One of the largest wingspans in the world (from 2.51 – 3.5 m)
- Coming ashore on Sub-Antarctic islands to breed
- Their plumage changes with age
- They lay single eggs

20,000

- There are approximately 20,000 in the world today

18

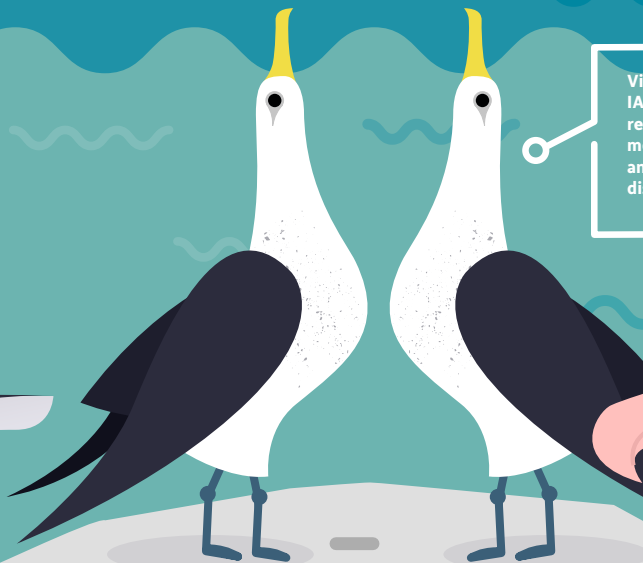

18 species of albatrosses breed on the Southern Ocean/South Atlantic islands

Most species of albatross eat squid as the main component of their diet. In addition, they eat fish, crustaceans and krill, especially in the Southern Ocean

1

The Light-mantled Albatross is the only albatross to breed in Antarctica, with several pairs at King George Island

Visitors travelling with IAATO members are required to keep at least 10 metres (30 ft) from nesting and 25 metres (75 ft) from displaying albatrosses
